1.0 Introduction

In 2021, Lake Macquarie City Council (LMCC) commissioned Nelson Heritage Consulting (NelsonHC) to prepare a Conservation Management Plan (CMP) for the nine cemeteries under their management.

The methodology developed by NelsonHC and Heritage, Archaeology + Planning included archival photographic recording to ensure high resolution capture of significant cemetery features and digital surveying incorporating terrestrial and aerial survey to ensure the highest degree of accuracy.

Darrell Rigby (Heritage, Archaeology and Planning) provided the archival photographic recording and Royce Sutherland (RPS Australia) undertook digital mapping incorporating terrestrial and aerial survey.

This report comprises LMCC Conservation Management Plan – Cemeteries. Volume 3.

1.1 The Project Area

This report has been prepared for nine heritage cemeteries distributed across the Lake Macquarie Local Government Area (LGA). The nine cemeteries are;

- Belmont Cemetery
- Catherine Hill Bay Cemetery
- Johnston Family Cemetery (Barnsley)
- Morisset Cemetery
- Martinsville Pioneer Cemetery
- Toronto Cemetery
- West Wallsend Cemetery
- Whitebridge Cemetery
- Wyee Cemetery

1.2 Limitations

The ability to physically photograph all significant grave sites was determined largely by built structures that presented limited vision or access or both. Additionally, some grave sites were obscured by natural elements such as encroaching vegetation and at Catherine Hill Bay encroaching sand dunes. Modern grave markers often only have headstones, so no gravesites were captured for these. Irrespective all historically significant gravesites as identified in this report were captured.

1.3 Photographer

This report has been prepared by HA+P Principal Heritage Consultant, Darrell Rigby an expert in the provision of archival photographic reports for indoor and outdoor built heritage items, places, and landscapes. Those projects have been carried out across Australia for commercial, Local, State and Commonwealth agencies.

2.0 Archival Recording Details

2.1 Photography

To understand and evaluate the project each of the nine cemeteries was visited twice. The first field inspection occurred between January 18-20th, 2021 and was designed to identify significant gravesites at each location and record their GPS positions, along with a low-resolution image. This was later provided to the mapping team to streamline their spatial requirements and create efficiencies for the field work. The initial visit was also used to identify potential problems that may have forestalled or excluded the planned digital aerial capture and terrestrial measurement methodology.

The second stage of fieldwork commenced on February 15th, 2021 which facilitated full resolution archival photography and the digital aerial mapping to begin. Due to weather conditions preventing drone usage on some days the work was finally completed on February 26th. In total 345 different shots were captured across the nine cemeteries in both JPEG and RAW file formats.

Photographic prints and contact sheets have been printed with Epson archival long-life inks on Ilford Professional smooth pearl paper, which has a 150 year lifetime. They are stored in archival quality 90-micron polypropylene print sleeves.

2.1.1 Equipment

Photography was carried out using a Panasonic DMC LX100 range finder style camera. The camera features a 2.8 Megapixel 4/3-inch High Sensitivity MOS Sensor combined with a Leica 24-75mm @ f/1.7-2.8 Lens (35mm equivalent.). The wide angle of the lens and light sensitivity of the sensor makes this an ideal archival photographic camera due to its ability to shoot using natural light in a variety of situations. The camera has full manual control with RAW image support. Images were shot using both JPEG and RAW image formats.

A tripod was used at a consistent height and distance from each gravesite (where possible) to allow a comparison between all nine cemeteries should the need arise.

2.1.2 Technique

Gravesites do not allow for a landscape aspect ratio to be used when viewed from directly in front. The result is a lot of wasted space on the edge of frame and a smaller than useful image of the object in question, which in most cases was a clear and legible rendition of the headstone inscription. The same could be said for portrait aspects, which although lending themselves better to the capture of the gravesite, again wastes space at the top and bottom edges of frame. For this reason, all gravesites were shot using a 1:1 aspect ratio, or square format. Resolution for these shots are 3088 x 3088 pixels which will effectively reprint up to A2 size.

All general cemetery landscape shots were captured using a 16:9 aspect ratio to better capture the landscape and compliment what is seen by the human eye. Resolution for these shots are 4480x2520 pixels which again will reprint up to A2 size with no problems.

Each image has file information attached to it detailing the size of the photograph in MB, dimensions, date of capture, camera information such as the frame speed (eg 1/200), ISO value (eg 200), lens position (eg 12.5mm) and the filename. This is the case for both JPEG and RAW file formats.

All historic gravesites were photographed showing the whole gravesite first to create a master shot of each location, followed by a close up of the headstone inscription. Manual focus was used in all shots. In some cases where there were stelae featuring burial inscriptions on several faces, these were captured individually as well. In instances where inscriptions may have been faint or hard to decipher several shots were taken using different angles and aperture settings. Sometimes small metal plates attached to gravesites had transcripts of the inscriptions and where they occurred these were also photographed.

High resolution aerial capture of all nine cemeteries was undertaken using a drone, with the reference points detailed on the map sheets. These files are necessarily large and as such have been provided as digital download. Where possible and allowing for weather conditions compass points of the cemeteries were captured at each location.

2.2 Mapping

Mapping was conducted both terrestrially (GPS) and from the air (drone) by RPS. Survey datums were established at each location to adopt MGA GDA20 (Zone 56) and Australian Height Datum (AHD). GPS accuracy both vertical and Horizontal was sufficient for terrestrial survey data capture of each of the significant gravesites at ground level. The terrestrial survey was also used to capture interesting landmarks, unusual grave layouts and similar. Individual heritage elements were captured as directed by the heritage consultants on site.

The methodology employed for the mapping work was as follows;

- Obtain DCDB and SCIMS Spatial Services information
- Pre-Field flight planning

Field survey to capture high resolution aerial imagery and archival specific elements;

- High resolution 1.5cm²/pixel aerial imagery from drone

Office data reductions and processing;

- Preparation and drafting of survey plan.
- Provision of pdf plan and digital data in DWG format;
- Delivery of mosaic type .tif georeferenced imagery for each site

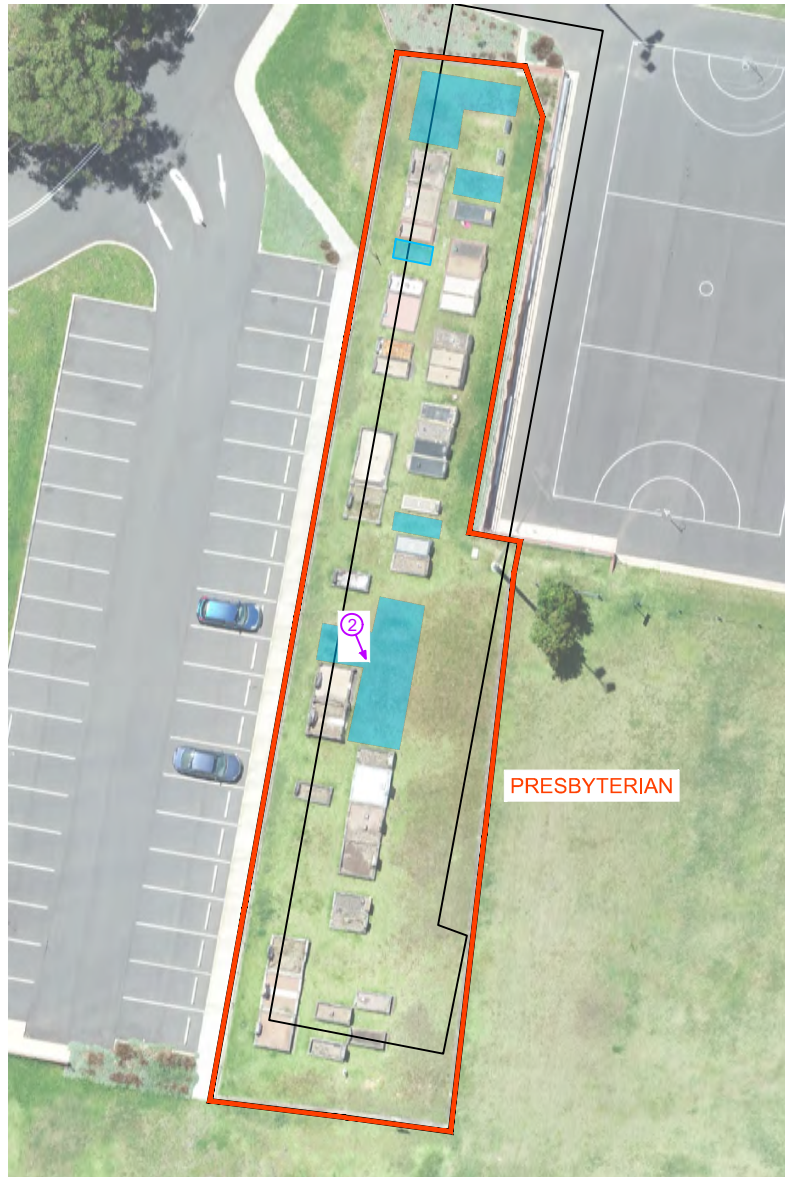

3.0 Maps

Following are nine maps covering each of the nine cemeteries. Each map has its own Legend and all maps follow the same format and colours. The Cyan coloured overlay denotes areas of potential unmarked burials, the Blue outline marks significant gravesites, Red is used to denote areas of denomination or areas of historic interest with cadastral information detailed in Black. In those cemeteries that have columbaria's, these were marked in Green and in others featuring shelters Yellow is used.

In all maps there is a site location inset, north arrow and scale.

Page intentionally left blank.
